

SWIGGY

Power BI Analytics

Combined PDD + SDD Presentation

Food Delivery Business Intelligence

A clear project, solution and dashboard design story based on the uploaded Power BI

Prepared for GitHub Portfolio

Madhumitha | Power BI • SQL • Excel • Python

Project at a Glance

Business Need

Bring order, revenue, restaurant and payment signals into one interactive analytical view.

Solution

A single-page Power BI report with KPI cards, charts and five slicers.

Outcome

Fast KPI monitoring plus drill-down through city, cuisine, payment, status and date.

- PBIX evidence: 1 report page with 17 visual containers.
- Model entities identified: Orders, Restaurants, Customers and Dax Measures.
- Core measures identified: Total Revenue, Total Orders, Average Order Value and Cancellation Rate.
- Report visual queries apply an OrderDate filter from 1 January 2024 onward.

Business Problem & Objectives

Business Problem

Food-delivery data contains multiple dimensions—orders, revenue, restaurants, payment methods, ratings, cuisine and order status. Without a unified view, it is harder to monitor performance and investigate patterns quickly.

Project Objectives

1. Monitor revenue and order KPIs.
2. Track monthly revenue movement.
3. Explore restaurant-level revenue.
4. Understand payment behavior.
5. Examine rating vs AOV.
6. Analyze cuisine and order status.
7. Enable interactive filtering.

Scope, Users & Requirements

In Scope

- Power BI dashboard
- Semantic model
- DAX measures
- KPI monitoring
- Revenue/order analysis
- Restaurant/cuisine analysis
- Payment and status analysis
- Interactive slicers

Primary Users

- Business / Operations Analyst
- Management / decision makers
- Restaurant / category analyst
- Data Analyst / BI Developer

Key Requirements

- FR-01 Revenue KPI
- FR-02 Orders KPI
- FR-03 AOV KPI
- FR-04 Cancellation KPI
- FR-05 Monthly revenue trend
- FR-06 Restaurant revenue
- FR-07 Payment distribution
- FR-08 Rating vs AOV
- FR-09 Cuisine + status
- FR-10 Five slicers

Solution Architecture

- The PBIX separates business calculations into a dedicated Dax Measures entity.
- Report visuals consume model fields and measures through Power BI filter context.
- The architecture is suitable for portfolio demonstration and can be extended with a governed production data source.

Semantic Model & Data Design

Orders

Order Month
Net Revenue
Payment Method
Order Status
Order Date

Restaurants

Restaurant Name
Rating
Cuisine
City

Customers

Customer-related model entity.
Present in the model; no direct field reference was identified on the report page.

- The PBIX model diagram contains four entities.
- Exact relationship keys/cardinality are not asserted here because the extracted layout metadata does not expose them reliably.
- Production documentation should copy the final relationship definitions from Power BI Model view.

Dax Measures

Total Revenue
Total Orders
Average Order Value
Cancellation Rate

KPI & DAX Measure Design

TOTAL REVENUE

Aggregate revenue represented by the report data.

TOTAL ORDERS

Order-volume measure used across KPI and category visuals.

AVERAGE ORDER VALUE

Average revenue value per order.

CANCELLATION RATE

Rate of orders classified as cancelled.

- Centralized measures improve consistency because the same calculation can feed multiple visuals.
- The exact DAX expressions should be copied from Power BI Desktop before production handover; the PBIX layout exposes the measure names but not dependable plain-text formulas.

Dashboard Design Blueprint

KPI 1

Total Revenue

KPI 2

Total Orders

KPI 3

Average Order Value

KPI 4

Cancellation Rate

Monthly Revenue Trend

Line chart

Axis: Order Month

Value: Sum of Net Revenue

Restaurant Revenue

Clustered bar chart

Category: Restaurant Name

Value: Total Revenue

Top-10 restaurant selection in the visual query

Payment Method

Donut chart • Total Orders

Rating vs AOV

Scatter • Rating × Average Order Value

Cuisine + Status

Column chart • Cuisine × Total Orders,
segmented by Order Status

Interaction & Filter Design

CITY

Restaurants.City

CUISINE

Restaurants.Cuisine

PAYMENT METHOD

Orders.PaymentMethod

ORDER STATUS

Orders.OrderStatus

ORDER DATE

Orders.OrderDate

- Users can combine slicers to create a focused analytical view.
- The report uses Power BI filter context so relevant KPIs and visuals update together.
- The extracted visual queries include an OrderDate filter beginning 1 January 2024.

Visual-to-Business Question Mapping

Visual	Business Question	Analytical Purpose
KPI cards	What is the current headline performance?	Revenue, orders, AOV, cancellations
Line chart	How does net revenue move by month?	Trend monitoring
Restaurant bar	Which restaurants contribute revenue in the displayed selection?	Restaurant analysis
Payment donut	How are orders distributed by payment method?	Payment behavior
Scatter	How do restaurant ratings relate to AOV?	Relationship exploration
Cuisine/status columns	How are orders distributed across cuisines and statuses?	Category + status analysis

Validation & Testing Plan

ID	Area	Validation
T01	Revenue KPI	Reconcile against source/model aggregation.
T02	Order KPI	Validate order-count definition.
T03	AOV	Manually calculate a sample and compare.
T04	Cancellation	Validate cancelled-order definition.
T05	Slicers	Apply each slicer and confirm expected filtering.
T06	Charts	Check axes, aggregations and category/status behavior.
T07	Model	Validate relationships in Model view.
T08	Performance	Use Performance Analyzer before publishing.

Security, Deployment & Maintenance

Security

- Never commit credentials/API keys.
- Do not publish confidential source data.
- Remove customer PII from public repositories.
- Use only authorized datasets and images.

Deployment

- Validate in Power BI Desktop.
- Save final PBIX.
- Publish to an authorized Power BI workspace.
- Configure refresh separately.
- Keep secrets outside GitHub.

Maintenance

- Update PDD when scope changes.
- Update SDD when model/visual architecture changes.
- Refresh README screenshots.
- Version major dashboard releases.

GitHub Repository Structure

Portfolio Story

README → explains the project
PDD → explains the business design
SDD → explains the technical solution
PBIX → contains the actual dashboard

Important

Only publish datasets and assets you are legally allowed to share.

From data → insight → decision

- Business design is defined through the PDD requirements, scope, KPIs and users.
- Technical design is defined through the SDD architecture, model, measures, visuals, testing and deployment.
- The uploaded PBIX provides the implementation evidence for the dashboard structure.
- This combined presentation is ready to accompany the GitHub portfolio repository.

Deliverables

- ✓ PBIX
- ✓ Combined PDD + SDD presentation
- ✓ PDD document
- ✓ SDD document
- ✓ README.md
